According to our (Global Info Research) latest study, the global Anti-Skid Friction Test market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

An anti-skid friction test, also known as a skid resistance test, is a procedure used to assess the frictional characteristics of road surfaces, runways, and other transportation infrastructure. The primary purpose of this test is to measure the level of traction or grip provided by the surface to vehicles or aircraft, especially under adverse conditions such as wet, icy, or slippery surfaces. Skid resistance tests are essential for ensuring road safety, preventing accidents, and maintaining the usability of transportation infrastructure.

The development of more advanced and sensitive sensors has allowed for more precise measurement of friction between tires or wheels and road surfaces. These sensors can capture data at higher speeds and provide more detailed information about skid resistance.
