Abstracts

Monoclonal Antibodies (IgMs) are antibodies that are made by identical immune cells, cloned from a single parent cell. They are therefore of constant structure and bind to the same foreign markers (called ?antigens?). The technology behind the generation of monoclonal antibodies was discovered in 1972 by C?sar Milstein and Georges K?hler ? scientists at the Roche-funded Basel Institute for Immunology ? who were later to win the Nobel Prize. Monoclonal antibodies revolutionized biological research and built the basis for the use of therapeutic antibodies in medicine and for the entire biotechnology industry.

In Vitro Diagnostics (IVD) are tests used to detect disease, infections and other medical conditions. The growing need of IVD testing arises due to increasing incidences of chronic and infectious diseases and growing geriatric population prone to immunological disorders. Moreover, increased application of personalized medicines and widespread knowledge of rare diseases are boosting the growth of IVD market. In the recent years, antibody used for IVD industry developed rapidly in China
