The global Anticancer Drugs market size is expected to reach \$ 480980 million by 2032, rising at a market growth of 11.0% CAGR during the forecast period (2026-2032).

Anticancer drugs are medications used to treat cancer by targeting and killing cancer cells or inhibiting their growth. Anticancer drugs are medications specifically designed to combat cancer by either inhibiting the growth of cancer cells or inducing their death. These drugs operate through various mechanisms, such as disrupting the cell cycle, interfering with specific signaling pathways crucial for cancer cell survival, or targeting the blood vessels that support tumor growth. Anticancer drugs encompass a diverse range of classes, including cytotoxic drugs, targeted therapies, hormone therapies, immunotherapies, and angiogenesis inhibitors. The selection of these drugs depends on the type of cancer, its stage, and individual patient characteristics. While these medications play a crucial role in cancer treatment, they may also have side effects due to their impact on rapidly dividing normal cells.

Global key players of Anticancer Drugs include Merck & Co, Bristol-Myers Squibb, Roche, Novartis, Johnson & Johnson, etc. The top five players hold a share over 55%. North America is the largest market, and has a share about 55%, followed by Asia-Pacific and Europe with share 21% and 19%, separately. In terms of product type, Targeted Therapy is the largest segment, occupied for a share of 58%. In terms of application, Blood-related Cancer has a share about 23 percent.
