Abstracts

Lipids are chemical substances that are insoluble in water such as cholesterol and triglycerides. Hyperlipidemia is a medical condition marked by elevation of lipid level in the blood. This rise in lipid levels leads to increase in fatty deposits in arteries, which cause blockages in the arteries of the patient. The blockages can in turn lead to rise in risk related to heart attacks. Therefore, hyperlipidemia is a major medical condition that requires treatment. The drugs that are used to treat hyperlipidemia are called as antihyperlipidemic drugs. Some of the drugs available in the market include bile acid, sequestrants, cholesterol absorption inhibitors, and others.
