Abstracts

The global Antimony Trichloride market size is expected to reach \$ 533 million by 2032, rising at a market growth of 5.0% CAGR during the forecast period (2026-2032).

Antimony Trichloride (SbCl_3) is an inorganic antimony halide consisting of trivalent antimony and chlorine. It appears as a white to pale yellow crystalline solid that is hygroscopic and readily hydrolyzes in water to form antimony oxychlorides and hydrochloric acid. It is widely used as a catalyst and intermediate in organic synthesis, chlorination reactions, flame retardant production, pharmaceutical and fine chemical manufacturing, analytical reagents, and in the preparation of other antimony compounds. The supply chain begins with the mining and beneficiation of stibnite (Sb_2S_3) ore, followed by smelting and refining to produce antimony metal or antimony trioxide (Sb_2O_3). Antimony trichloride is then manufactured primarily by the direct chlorination of antimony metal or by reacting antimony trioxide with hydrochloric acid and chlorinating agents under controlled conditions. After purification through distillation or recrystallization to achieve industrial, reagent, or high-purity grades, the product is packaged and distributed through chemical manufacturers and specialty chemical suppliers to downstream industries including pharmaceuticals, agrochemicals, specialty chemicals, flame retardants, electronics, laboratory chemicals, and research institutions. In 2025, global Antimony Trichloride output was about 160,000 tons with 190,000 tons of capacity, average prices of USD 2,000-5,000 per ton, and gross margins around 22%.
