Aorta is the largest artery in the human body that arises from the left ventricle of the heart and travels to the abdomen. It is divided into different branches that reach to the chest, abdomen and leg of the body. Aorta serves as the supplier of the oxygenated blood to all these organs and tissues. Aortic intervention is the surgical procedures in which patient's aortic valve are replaced with the artificial aortic heart valve. The intervention of the valve is prescribed when aortic valve is partially or completely blocked. The intervention can be performed by minimally invasive procedure or by open heart surgical procedures i.e. catheter based aortic valve replacement.
