Abstracts

According to our (Global Info Research) latest study, the global Apolipoprotein E Genotype Test Kit market size was valued at USD 92 million in 2023 and is forecast to a readjusted size of USD 369.3 million by 2030 with a CAGR of 22.0% during review period.

Apolipoprotein E is an important structural component of particles transporting cholesterol (VLDL, HDL) and is a ligand of cell receptors found mainly in the brain and the liver. The apolipoprotein E gene occurs in three forms of alleles, e2, e3 and e4, which code for protein isoforms E2, E3 and E4 respectively. APOE genotype tests are help understand the role of genetic factors in cardiovascular disease. However, the testing is sometimes used in clinical settings to help confirm a diagnosis of type III hyperlipoproteinemia (also known as familial dysbetalipoproteinemia). The APOE genotype test evaluates a person's DNA to determine what APOE forms (alleles) are present. APOE e3/e3 is the most common genotype (seen in well over half of the population) and is considered "neutral." Risks of disease are made relative to the e3/e3 population. APOE e4 (as e4/e4 and e4/e3) is found in nearly a quarter of the population and is associated with an increased risk of atherosclerosis. The e4 allele of the APOE gene has been widely demonstrated to be associated with increased risk of AD. In individuals with a clinical diagnosis of AD, the presence of the e4 allele increases the likelihood that the diagnosis is correct, but is not diagnostic alone. APOE genotyping is not recommended for predicting AD risk in asymptomatic individuals. In this report, we study Apolipoprotein E Genotype Testing, kit and services are covered. Price is the cost of one test.
