Abstracts

Application shielding, also sometimes referred to as runtime application self-protection, is the concept of having an application environment ? or even the application itself ? detect and prevent attacks in real-time. While traditional IT environments may not be able to apply this concept to every application or system, mobile applications can make use of application shielding. For instance, many Android applications will prevent users from performing financial transactions if the Android device is rooted. Properly implemented, application shielding will mitigate many of the in-network risks presented by the Cadbury Egg security approach. The report analyzes application shielding software market.
