## **Abstracts**

The global Application Transformation Management Services market size is expected to reach \$ 29005 million by 2032, rising at a market growth of 12.0% CAGR during the forecast period (2026-2032).

Application transformation management service refers to the professional service of migrating, refactoring, or replacing existing software applications from one operating environment (such as an operating system, hardware architecture, programming language, or database platform) to another target platform through systematic technical methods and engineering processes. Its core goal is to address application compatibility issues caused by outdated technology, platform upgrades, business integration, or compliance requirements, while maximizing the preservation of existing business logic, functional features, and data integrity. Depending on the conversion strategy, this service can cover code porting (such as migrating from .NET Framework to .NET Core?? Language conversion (such as rewriting COBOL to Java), architecture refactoring (transforming monolithic architecture into microservices), platform upgrades (such as adapting Windows 7 applications to Windows 11), and data migration at multiple levels. Application conversion services typically include the entire process of existing system evaluation, conversion scheme design, automated tool assisted conversion, manual code refactoring, testing and validation, and deployment and launch. They are widely used in industries such as finance, government, healthcare, and manufacturing for information transformation, localization substitution, cloud migration, and legacy system modernization projects. They are a key means for enterprises to ensure business continuity and reduce technical debt in the process of digital transformation. Unlike pure system integration or data migration, application transformation focuses more on adjusting the logical structure and operating mode of

the application itself to achieve long-term technological autonomy and architectural evolution.

The industry chain of application transformation management services covers upstream software development tools, cloud infrastructure, and automation transformation platform providers, midstream system integration and professional service providers (providing customers with full process services from legacy system evaluation, application composition analysis, code transformation, architecture reconstruction to cloud migration), and downstream various industry application terminals (covering BFSI, IT and telecommunications, government and defense, healthcare, retail and e-commerce, etc.). In terms of gross profit margin, due to the fact that this service is centered on knowledge and technology and belongs to high value-added technical services, the overall gross profit margin of the industry is at a relatively high level, usually between 35% and 55%, depending on the type of service and project complexity.

Application transformation management services have evolved from the traditional 'passive firefighting' approach to addressing technological obsolescence to an 'active strategic choice' for enterprises to accelerate digital transformation and reshape core competitiveness. Its value is no longer limited to mechanically translating old applications from A language to B language to solve compatibility issues, but through systematic evaluation and modernization (such as microservice splitting, cloud native adaptation, and domestic architecture reconstruction), it transforms the once rigid and costly 'technical liabilities' into agile, scalable, and cost controllable 'digital assets'. Especially in the dual wave of domestic substitution and comprehensive cloudification of Xinchuang, application transformation has become a necessary path for enterprises to break through supplier lock-in and achieve technological autonomy and controllability. Therefore, the essence of this service is a 'dual reconstruction of business processes and technology stack', which requires service providers not only to be proficient in various development languages and platform features, but also to deeply understand the customer's business logic and industry rules. Ultimately, what is delivered is not a code, but a new technology foundation that can respond agilely to future business changes and significantly reduce the total cost of ownership.
