According to our (Global Info Research) latest study, the global Aquaculture Circulating Water Treatment Filter Media market size was valued at US\$ 47.33 million in 2025 and is forecast to a readjusted size of US\$ 90.23 million by 2032 with a CAGR of 9.8% during review period.

Aquaculture recirculating aquaculture system (RAS) filter media is a core water treatment medium used in these systems. It primarily removes and transforms suspended particles, organic matter, and harmful nitrogenous metabolites from the aquaculture water. These media typically possess a high specific surface area and excellent hydraulic properties, providing a stable attachment and growth environment for beneficial microorganisms such as nitrifying bacteria. Through the synergistic effect of physical interception and biodegradation, they continuously convert toxic substances such as ammonia nitrogen and nitrite into low-toxicity or non-toxic forms, thereby maintaining water quality stability, reducing water exchange rates, and increasing stocking density. They are an indispensable key material in industrialized and large-scale aquaculture systems. In 2025, sales volume was 7,500 tons, with an average price of US\$5,500 per ton, a gross profit margin of 47%, and a total production capacity of 8,500 tons.

The aquaculture recirculating water treatment filter media market is being driven by both upgraded environmental protection requirements and the intensive development of the industry. As global aquaculture moves towards large-scale and standardized operations, coupled with increasing water resource pressure and stricter emission regulations, traditional simple water exchange models are gradually being replaced by efficient recirculating water treatment systems. Under this trend, high-performance filter

media has become a core component of recirculating aquaculture systems. Its role extends beyond physical filtration of suspended particles; it also plays a crucial role in biofilm formation, ammonia nitrogen removal, and other critical functions. This has shifted the filter media market from a focus solely on cost-effective 'consumable procurement' to a value-driven approach emphasizing comprehensive treatment efficiency, pollutant removal capacity, and system stability.

From a technological and competitive perspective, aquaculture recirculating water treatment filter media is moving towards multi-functionality, long lifespan, and integrated system solutions. Traditional low-end filter media such as sponges and perlite are being replaced by new materials such as functionalized ceramic granules, bio-reinforced fillers, and nano-coated composite media. These materials offer significant advantages in specific surface area, pore structure, biofilm formation, and self-cleaning capabilities. Furthermore, with the integration of recirculating aquaculture systems and monitoring and control platforms, filter media, as a key node in the entire treatment chain, is becoming a crucial factor in customer selection regarding system stability and maintenance cycles. In the future, the industry will place greater emphasis on improving the performance of the filter media itself, its synergistic design with water treatment systems, and optimizing long-term operating costs, driving the filter media market to evolve from 'single-item procurement' to a 'system solutions and service model.'
