Abstracts

According to our (Global Info Research) latest study, the global Anti-block Additives market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Anti-block additives are used to prevent polyolefin film sheets from sticking together. These films, when being in close contact, stick to each other due to electrostatic charges. This stickiness depends on the temperature, pressure, and processing time of the plastic films. Anti-block agents are added to polyolefins and other polymers in low concentrations to prevent the adherence of layers.

The demand for anti-block additives is increasing in the food and packaging industry due to the rising preference for packaged food and the application of plastic films. There is an increasing demand for packaged food due to its easy consumption and increase in health awareness. This in turn, will boost the sales of anti-block additives from this segment.
