## Abstracts

The global Aquaculture market size is expected to reach \$ 1249820 million by 2032, rising at a market growth of 5.5% CAGR during the forecast period (2026-2032).

Aquaculture, also known as aquafarming, is the farming of aquatic organisms such as fish, crustaceans, molluscs and aquatic plants. Aquaculture involves cultivating freshwater and saltwater populations under controlled conditions, and can be contrasted with commercial fishing, which is the harvesting of wild fish. Broadly speaking, the relation of aquaculture to finfish and shellfish fisheries is analogous to the relation of agriculture to hunting and gathering. Mariculture refers to aquaculture practiced in marine environments and in underwater habitats.

The global aquaculture market demonstrates substantial growth potential, driven by the rising demand for seafood as a sustainable and high-protein alternative to wild-caught fish, as overfishing, environmental concerns, and population growth pressure traditional fisheries, prompting governments, private enterprises, and investors to expand fish, shrimp, shellfish, and other aquatic species farming operations across Asia-Pacific, Latin America, Europe, and North America; increasing consumer awareness regarding nutrition, traceability, and food safety, coupled with the shift toward healthy diets and high-protein consumption, is fueling demand for farmed seafood products, while innovations in selective breeding, recirculating aquaculture systems (RAS), automated feeding, water quality monitoring, and disease management are enhancing productivity, yield, and sustainability, enabling intensive and semi-intensive farming even in regions with limited natural water resources; government policies, subsidies, and incentives supporting sustainable aquaculture, along with certifications such as ASC, BAP, and organic labeling, are encouraging adoption of environmentally responsible practices and boosting market credibility, while the growth of e-commerce, cold-chain logistics, and

international trade is expanding access to global markets and premium seafood segments; high-value species such as salmon, shrimp, and tilapia, along with emerging segments like algae, mussels, and ornamental fish, offer opportunities for diversification and revenue growth, while investments in research for disease-resistant strains, feed optimization, and low-impact production techniques are reducing operational costs and ecological footprint; additionally, the integration of technology such as IoT-enabled sensors, AI-driven feed management, and blockchain-based traceability is driving efficiency, transparency, and profitability; despite challenges such as climate change, disease outbreaks, and regulatory compliance, the combination of technological innovation, rising global seafood consumption, sustainability trends, and supportive policy frameworks positions the aquaculture market for strong and resilient growth over the next decade, with opportunities spanning both commercial-scale and smallholder operations across diverse geographic regions.
