## Abstracts

According to our (Global Info Research) latest study, the global AR PROTAC Drugs for Cancer market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ 765 million by 2032 with a CAGR of 24.7% during review period.

No AR PROTAC Drugs for Cancer have yet been approved for market launch. Drugs from major manufacturers are currently in the pipeline research and clinical trial stages, in a critical sprint before market launch, and the competitive landscape is beginning to emerge.

AR PROTAC Drugs for Cancer are targeted protein degraders designed to eliminate the androgen receptor (AR) protein inside cells rather than simply blocking it. They are typically heterobifunctional small molecules with three parts: (1) an AR-binding ligand that attaches to the androgen receptor, (2) an E3 ligase–recruiting ligand (commonly CRBN or VHL) that brings in the cell’s ubiquitin machinery, and (3) a linker connecting the two. By forming a ternary complex (AR–PROTAC–E3 ligase), they promote ubiquitination of AR and subsequent proteasomal degradation, which can provide deeper pathway suppression and may help overcome some resistance mechanisms seen with conventional AR antagonists.

AR PROTAC Drugs for Cancer are attracting outsized attention because they aim to solve a central pain point in androgen-driven disease—especially advanced prostate cancer—where simply blocking the androgen receptor can fail as tumors adapt through receptor overexpression, activating mutations, or pathway rewiring; by inducing selective degradation of the AR protein itself, PROTACs offer the potential for deeper and more durable pathway suppression and a way to restore control in settings where

conventional antagonists lose traction. This “event-driven” mechanism can translate into meaningful advantages in practice: activity at lower effective target occupancy than inhibitors, the possibility of overcoming certain resistance patterns tied to sustained receptor signaling, and a clearer rationale for combination strategies that are limited today by overlapping toxicities or diminishing incremental benefit. The industry is being propelled by converging drivers—validated clinical proof-of-concept for targeted protein degradation, accelerating medicinal chemistry and structural biology that improve oral drug-like properties and selectivity, a strong need for differentiated assets in crowded hormonal therapy markets, and a financing and partnering environment that rewards platform technologies capable of generating multiple candidates across targets. Looking ahead, AR PROTACs are likely to evolve from a niche “last-line salvage” concept into a competitive therapeutic class where next-generation molecules differentiate on safety, tolerability, and performance against real-world resistance, with market potential expanding as clinical positioning becomes clearer, physician confidence grows, and manufacturing and regulatory pathways mature for this now-established but still rapidly innovating modality.

AR PROTAC Drugs for Cancer' upstream raw materials mainly include AR Targeted Ligands, E3 ligase ligands, Linker, excipients, etc. Typical suppliers include Bio-Techne, Merck, Sigma-Aldrich, Enamine, etc., while downstream applications are mainly in the treatment of prostate cancer and other diseases.
