Architectural Clad Metal refers to composite metal materials used in building facades and decorative applications. These materials typically consist of weather-resistant metals (such as aluminum alloys or stainless steel) combined with decorative or functional layers, enhancing strength, durability, and aesthetics through cladding techniques. Clad metals improve the appearance of buildings while offering additional protective features, such as corrosion resistance and weather resistance.

As architectural design increasingly demands both aesthetics and functionality, the use of clad metals in buildings is becoming more widespread. Modern architects and designers are focusing on the visual appeal and durability of materials, driving innovation in composite metals. Current trends include the use of metal panels with unique textures and colors for distinctive designs. Environmental sustainability is also a key trend, with many architectural clad metals made from recyclable materials and designed to have minimal environmental impact, aligning with green building standards.
