Abstracts

According to our (Global Info Research) latest study, the global Aromatic Prepolymer market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Aromatic prepolymers are prepolymers produced by the partial reaction of aromatic isocyanates (such as TDI or MDI) with polyols. They contain aromatic ring structures, which give the material excellent mechanical properties and chemical stability. Aromatic prepolymers are usually used to produce polyurethane elastomers, coatings and adhesives. They have high strength and chemical resistance, but poor weather resistance and UV resistance, and are prone to yellowing under UV irradiation. Therefore, this type of prepolymer is suitable for indoor applications or environments with low requirements for UV stability.
