## Abstracts

According to our (Global Info Research) latest study, the global Arterial Occlusion Device market size was valued at US\$ 1803 million in 2025 and is forecast to a readjusted size of US\$ 2939 million by 2032 with a CAGR of 7.1% during review period.

Arterial occlusion devices are medical devices designed to create controlled interruption of arterial blood flow via endovascular or surgical approaches, supporting emergency hemorrhage control, intraoperative blood-loss reduction, vessel exclusion, or therapeutic embolization. By duration, they are commonly grouped into temporary occlusion (e.g., intravascular balloon occlusion catheters such as aortic occlusion for life-threatening bleeding) and permanent occlusion (e.g., vascular plugs and coils that produce durable vessel blockage). Core differentiation centers on occlusion reliability, precise controllability, radiographic visibility, and vascular safety, operating as part of an integrated endovascular ecosystem with guidewires, sheaths, and imaging/navigation to enable repeatable clinical pathways and quality governance. In 2025, global Arterial occlusion device production reached approximately 4.38 million unit and price is 400USD/Unit. The average gross profit margin of this product is 55%.

Growth is driven by two converging needs: time-critical hemorrhage certainty and more minimally invasive flow control. In trauma care, military/EMS systems have been formalizing endovascular balloon occlusion into standardized shock management and increasingly emphasize finer strategies such as partial occlusion—shifting practice from reactive rescue to controllable occlusion. In parallel, therapeutic embolization continues to expand across peripheral intervention and interventional radiology. Permanent occlusion tools such as vascular plugs gain traction through predictable occlusion, repositionability, and procedural efficiency—supporting hospital-level consumable mix

upgrading.

The bar is not “can you occlude,” but “can you occlude safely and controllably.” Temporary occlusion must manage ischemic tolerance windows, reperfusion risk, and training dependency; permanent occlusion faces non-target embolization, migration, recanalization, and follow-up burdens. Regulators provide defined classification and clearance pathways for temporary intravascular occluding catheters, which also raises expectations for auditable indication boundaries, labeling, and training systems. Hospital adoption further depends on complication governance and multidisciplinary coordination, making pathway capability—not price alone—the decisive scaling factor.

Demand is shifting from single devices to scenario-based occlusion solutions. Trauma and critical care prioritize rapid flow control with seamless transfer-to-OR workflows; in obstetrics and other specialties, balloon-based flow control is being explored to reduce bleeding uncertainty in high-risk procedures, demonstrating cross-disciplinary spillover. In IR and peripheral vascular practice, plugs/coils are increasingly used as part of integrated sets with catheters, microcatheters, and imaging/navigation—driving preference for bundled supply, strong visibility, and stable occlusion outcomes and nudging suppliers from “selling a device” toward “delivering repeatable technique components.”

Upstream differentiation centers on integrated capability across metals, polymers, and radiopacity. Permanent occlusion devices commonly rely on nitinol mesh structures with radiopaque markers and connector mechanisms—demanding tight control over shape-memory behavior, fatigue performance, and manufacturing reproducibility; FDA summaries describe these structural and material attributes and implicitly reflect the engineering threshold. Temporary occlusion catheters depend on balloon materials, shaft pushability, and safety features such as pressure monitoring/relief. Supply chains must cover medical-grade polymers, lubricious coatings, sterile barrier packaging and sterilization validation, backed by strict change control to ensure batch-to-batch consistency in high-acuity use.
