## Abstracts

According to our (Global Info Research) latest study, the global Arteriosclerosis Model market size was valued at US\$ 281 million in 2025 and is forecast to a readjusted size of US\$ 391 million by 2032 with a CAGR of 4.9% during review period.

In 2025, global Arteriosclerosis Model production reached approximately 3.03 M Units. The average price is approximately \$90. Arteriosclerosis Model are physical or semi-digital teaching models used for medical teaching, patient education, clinical training, and scientific research demonstrations. Through the visual reconstruction of the structure and pathological changes of the arterial wall, they intuitively present the evolution of the artery from a normal state to hardening, stenosis, and even occlusion.

### Gross Profit Margin Level

The gross profit margin structure of the arteriosclerosis model is essentially an overlap of "educational equipment manufacturing" and "medical training value delivery": For basic models (injection molding/resin + coloring), the core costs lie in mold amortization, manual painting time, packaging, and quality inspection. Once a stable SKU and large-scale distribution channels are established, the gross profit margin can usually be maintained within a healthy range. Mid-to-high-end models with soft and hard composite materials, transparent display structures, and AR/digital content integration, although with higher material and development costs, often have better gross profit margins due to stronger "classroom effectiveness/educational conversion" and higher bargaining power. It is important to note that overseas distribution systems (teaching equipment channels, medical education procurement platforms) significantly impact the manufacturer's "ex-factory gross profit": the difference in gross profit margin between

direct sales to universities/hospitals and resale through distribution channels for the same product can be very significant.

## Industry Drivers

The growth of arteriosclerosis models is driven by three simultaneous changes: First, the continuous strengthening of simulation-based learning (SBME) and patient safety-oriented training has led hospitals and educational institutions to pay more for teaching tools that are "repeatable, low-risk, and standardized." Second, cardiovascular chronic disease management is upgrading from "informing patients of risks" to "making mechanisms understandable to patients," with visualization of arterial stenosis, plaques, and thrombosis significantly improving communication efficiency and compliance. Third, 3D printing and digital content (including AR) are transforming models from "static teaching aids" into "comparative/interactive learning platforms," driving products to extend from low-priced individual items to "kits, courses, and content," thereby increasing the average order value and repeat purchases.
