The global Arthroscopic Suction Cutter market size is expected to reach $ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Arthroscopic suction cutter refers to a medical device used for arthroscopic surgery. Arthroscopy is a minimally invasive surgical procedure that allows surgeons to use the specialized instrument of an arthroscope (inserted into a joint through a small incision) to observe, diagnose, and treat joint-related problems.

Arthroscopic suction cutters combine suction and cutting functions in one device. It usually consists of a suction mechanism that clears fluid and debris from the joint space, and a cutting mechanism that allows the surgeon to precisely cut or trim tissue as needed during surgery. Suction helps maintain a clear view by removing blood and other fluids, while cutting capabilities enable precise tissue removal or reshaping.
