Abstracts

According to our (Global Info Research) latest study, the global Artificial Intelligence in Trading market size was valued at US\$ 158 million in 2024 and is forecast to a readjusted size of USD 260 million by 2031 with a CAGR of 10.1% during review period.

Implementation of artificial intelligence technology in trading or stock market change the overall shape of stock market. Artificial intelligence (AI) in the form of robo-advisers has already entered into the trading market. A robo-adviser simplifies the trading work flow, as it analyzes millions of data points and executes trades at the optimal price. Implementation of an AI platform for trading enables easy identification of complex trading patterns on a massive scale across multiple markets in real-time. It also makes daily workflow easier, improves business processes, increases contact center interaction, and reduces communication complexity.

The global Artificial Intelligence in Trading market is in a period of rapid growth, with the core driving force coming from the increased penetration of institutional quantitative strategies and the surge in demand for automated tools from retail investors. On the technical level, multimodal AI integrates text, image and voice data to generate investment insights, reinforcement learning optimizes high-frequency market-making strategies, and alternative data applications (satellite images, supply chain sensors) become the key to differentiated competition. In terms of regional structure, North America dominates the development of high-frequency algorithms, accounting for more than 40%, the Asia-Pacific retail market leads in growth (China restricts quantitative high frequency but promotes smart investment advisors), and Europe is driven by MiFID II regulation to drive compliance technology demand. Despite the huge market potential, overfitting risks), regulatory pressure (the EU AI Act requires algorithm transparency)

and data monopoly (head institutions invest more than US\$50 million annually to purchase exclusive data) are still the main challenges. In the future, generative AI will reconstruct investment research processes, quantum computing will optimize portfolio strategies, and ESG factor AI (such as Arabesque carbon emission forecasts) will become the direction of breakthrough, while small and medium-sized platforms may be eliminated faster due to technical barriers and cost pressures.
