Abstracts

The global Artificial Joint Head market size is expected to reach \$ 639 million by 2032, rising at a market growth of 4.3% CAGR during the forecast period (2026-2032).

Artificial Joint Head is a critical component of joint replacement prostheses, primarily used in hip joint surgeries. It serves as the spherical bearing surface that articulates with a corresponding cup, liner, or insert to replicate natural joint movement. Artificial joint heads are manufactured from various materials including metals (such as cobalt-chromium alloys, stainless steel, or titanium), ceramics (alumina, zirconia, or composite ceramics), and sometimes highly cross-linked polyethylene. These materials are selected for their strength, wear resistance, chemical stability, and biocompatibility to ensure long-term durability and minimize adverse tissue reactions. The heads are available in different diameters, typically ranging from 22 mm to over 40 mm, and can be connected to the stem via tapered interfaces or as monolithic one-piece designs. The proper selection of material, size, and connection type is crucial for restoring joint function, reducing friction and wear, and preventing dislocation or loosening. By providing smooth articulation under repetitive load and motion, artificial joint heads improve patient mobility, reduce postoperative complications, and enhance the longevity and functional outcome of joint replacement surgery.

In 2025, global Artificial Joint Head production reached approximately 3.06 million units, with an average selling price of around USD 152 per unit.
