The global Artificial Liver Support Systems market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The artificial liver support system is an extracorporeal support system that temporarily replaces some functions of the liver. Its therapeutic mechanism is based on the strong regenerative ability of liver cells. Through mechanical, physical, chemical and biological devices in vitro, it can remove various harmful substances, supplement essential substances, and improve internal organs. The environment creates conditions for liver cell regeneration and liver function recovery, or serves as a bridge before liver transplantation. It can be divided into three types: non-biological, biological and mixed.

This report studies the global Artificial Liver Support Systems production, demand, key manufacturers, and key regions.
