Abstracts

According to our (Global Info Research) latest study, the global As Type Infrared Detector Single Element market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Arsenic infrared detector units mainly refer to infrared detector units based on arsenic (As) or its compounds (such as gallium arsenide GaAs, indium gallium arsenide InGaAs, etc.) as sensitive materials. These detector units use the unique photoelectric properties of arsenic materials to convert infrared radiation energy into electrical signals, thus playing an important role in infrared spectrum measurement, infrared imaging, optical communication, environmental monitoring, medical diagnosis and other fields.

The market is constantly changing, and the following points are worth noting:

The market concentration is high.

The EU RoHS3 directive points out the restriction of the use of certain hazardous substances in electrical and electronic equipment. It regulates the use and introduction of hazardous substances in electrical and electronic components. RoHS stands for the Restriction of Hazardous Substances Directive, which refers to the restriction of the use of hazardous substances such as lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB) and polybrominated diphenyl ethers (PBDE).

With the introduction of the RoHS EU Restriction of Hazardous Substances Directive, infrared detectors based on mercury cadmium telluride (HgCdTe), lead selenide (PbS) and lead sulfide (PbSe) will be banned from industrial applications after July 2024,

which will further stimulate the transition to infrared detectors based on I-V semiconductors.
