## Abstracts

Aseptic packaging is a process whereby the product and the package are sterilised separately and brought together in a sterile environment. Aseptic packaging is often called 'drink boxes' and it allows perishable food products to be transported and stored without refrigeration for up to six months or more. It is used for foods such as milk and dairy products, puddings, fruit and vegetable juice, soups, sauces and products with particulates can be stored in aseptic packaging.

Aseptic packaging uses a much faster process than traditional canning. Canning requires the product to be heated in the can for around 50 minutes but liquids in aseptic packaging are flash heated outside the packaging for 3-15 seconds at a much higher temperature (90 – 140 degrees Centigrade). The sterile food is then placed in an airtight sterilised package. This preserves the food without chemical preservatives or refrigeration. It generally gives rise to products that are of superior quality compared to those processed at longer temperatures for longer times.

The aseptic packages are typically a mix of paper (70%), polyethylene (LDPE) (24%), and aluminum (6%), with a tight polyethylene inside layer. Together these materials form a tight seal against microbiological organisms, contaminants, and degradation, eliminating the need for refrigeration. This report only focus on carbon aseptic packaging materials industry.
