## Abstracts

The global ASIC Chip for E-cigarette market size is expected to reach \$ 2898 million by 2032, rising at a market growth of 7.4% CAGR during the forecast period (2026-2032).

ASIC Chip for E-cigarette is a specialized integrated circuit designed specifically for electronic cigarette applications, integrating precise voltage and current control, signal processing, and safety management on a single die to optimize heating coil performance, vapor production, and device responsiveness. Its advantages include high integration, stable output, low power consumption, rapid response, and enhanced reliability in e-cigarette devices. In 2025, production totaled 3096 million units with an average price of 0.55 USD/unit. The upstream primarily consists of silicon wafers, photolithography machines, and etching/deposition equipment, with representative suppliers such as ASML, Tokyo Electron, Applied Materials, and Lam Research providing critical semiconductor tools and materials. The midstream focuses on ASIC design, wafer fabrication, testing, and packaging processes, which determine chip performance, stability, and yield. The downstream applications are primarily electronic cigarettes, with key customers including RELX Technology, SMOK, Elf Bar, Innokin, Vuse, and SKE Technology.

ASIC Chip for E-cigarette plays a central role in controlling heating, power management, and vaporization efficiency in electronic cigarettes, making it essential for product performance and user experience. As devices become increasingly compact, modular, and battery-efficient, the demand for high-precision, low-power ASIC chips continues to rise. Manufacturers are focusing on improving integration, thermal management, and reliability to meet regulatory standards and consumer expectations. With evolving device designs and stricter quality requirements, ASIC chips are expected to remain critical in differentiating products, supporting innovation, and enhancing

operational efficiency across the electronic cigarette industry.
