Abstracts

According to our (Global Info Research) latest study, the global ASIC Firmware market size was valued at US\$ 412 million in 2025 and is forecast to a readjusted size of US\$ 1075 million by 2032 with a CAGR of 14.6% during review period.

ASIC Firmware is a specialized type of embedded software stored on the miner's control board, designed to operate and manage the underlying Application-Specific Integrated Circuit (ASIC) chips. It serves as the critical interface between the physical hardware and the blockchain network. Its primary responsibilities include initializing hashing chips, configuring voltage and frequency settings for hashboards, monitoring thermal and fan metrics, and executing mining protocols (such as Stratum) to fetch jobs and submit shares. In the 2026 landscape, modern firmware typically features Autotuning capabilities to dynamically optimize efficiency (J/T) based on individual chip quality and supports next-generation protocols like Stratum V2 to improve network decentralization.
