Abstracts

According to our (Global Info Research) latest study, the global Aspheric Achromat Lenses market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

Aspheric achromatic lens is an optical element, which adopts the design principle of aspheric lens and combines the characteristics of dispersion to achieve better imaging quality. Dispersion is the difference in the refractive index of light of different wavelengths in the lens, which will lead to chromatic aberration, that is, light of different wavelengths will converge at different positions, affecting the image quality. The aspheric achromatic lens can compensate for dispersion by designing the shape of the aspheric surface so that the refraction angles of different wavelengths of light in the lens are different. Compared with traditional spherical lenses, aspheric achromatic lenses can effectively reduce spherical aberration and chromatic aberration, and improve imaging quality and resolution. Aspheric achromatic lenses are widely used in the fields of optical instruments, imaging systems and laser processing.
