Abstracts

The global Aspirating Smoke Fire Detector market size is expected to reach $ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

An aspirating smoke fire detector is a device used to monitor fire smoke. It draws air from the monitoring area through a suction system and into the detector for analysis to detect smoke particles in the air. Once smoke is detected, it triggers an alarm and takes appropriate emergency measures. Aspirating smoke fire detectors usually consist of aspirating pipelines, filters, optical sensors, controllers and alarms. The suction line is responsible for extracting air from the monitoring area to the detector. The filter is used to filter impurities and particles in the air to ensure the normal operation of the sensor. The optical sensor is the core part of the detector. It detects smoke particles in the air through optical principles and sends the signal to the controller. The controller is responsible for receiving the sensor signal and judging and processing it according to the preset threshold. Once the detected smoke exceeds the set threshold, the controller will trigger the alarm to send out a sound or light signal to alert people of a possible fire.
