According to our (Global Info Research) latest study, the global ASR Conference Transcription Tool market size was valued at US\$ 994 million in 2025 and is forecast to a readjusted size of US\$ 1404 million by 2032 with a CAGR of 5.1% during review period.

The ASR meeting transcription tool is a software system based on automatic speech recognition technology, whose core function is to automatically and accurately convert real-time or recorded meeting audio content into structured text. This tool not only relies on deep learning models for speech-to-text conversion but often also integrates capabilities such as speaker separation, background noise suppression, and domain-specific terminology optimization. On this basis, advanced tools further provide features like automatic summarization, key point extraction, multilingual translation, and meeting knowledge graph construction, aiming to transform spoken content into intelligent meeting records that are searchable, analyzable, and shareable, thereby improving information flow efficiency and meeting value.

The development prospects are broad, with the core drivers coming from the normalization of hybrid work and enterprise digital transformation. With the integration of large model technology, its future will likely follow three main directions: first, advancing from "transcription" to "intelligent meeting analysis," deeply understanding content and providing decision support; second, evolving from "general-purpose" to "vertical industry expert" to meet the high-accuracy terminology requirements of fields such as law and healthcare; third, more deeply embedding into workflows, seamlessly connecting with systems like OA, CRM, and knowledge bases, becoming a "data relay station" for intelligent enterprise operations. Privacy protection and edge computing capabilities will

also become key competitive factors.
