The global Assisted Walking Standing Machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A walking upright machine is a rehabilitation aid that is commonly used to assist patients in need of rehabilitation with upright walking training. These devices, usually mechanical or electrical, provide support and stabilization, helping patients maintain an upright posture and provide proper support and balance while walking. Assisted walking uprights typically consist of a stand or frame with handles or armrests for the patient to hold and provide stability and balance. Some assisted walking uprights also come with a seat belt or lumbar support system for extra safety. When in use, the patient can stand on the device and be trained to walk upright with the support of the handlebars or armrests. Assisted walking upright machines are often used in rehabilitation, for example, for patients who have difficulty walking or are disabled due to stroke, spinal cord injury, motor neurone disease, etc. Through training with the Assisted Walking Standing Machine, patients can engage in muscle building, balance training, gait recovery, and simulation of activities of daily living to facilitate recovery and improve quality of life.
