According to our (Global Info Research) latest study, the global Asynchronous SRAM market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Asynchronous SRAM, also known as self-timed SRAM, is a type of static random-access memory (SRAM) that without a clock signal. Unlike synchronous SRAM, which relies on a synchronous clock to control data transfer, asynchronous SRAM eliminates the need for a global clock by using handshaking protocols. It each memory cell to operate independently, allowing for more and efficient data transfer. Asynchronous SRAM offers advantages such as lower power consumption, reduced electromagnetic interference, and greater robustness against timing issues. It is commonly used in applications where timing uncertainties or variations are present, such as in aerospace, automotive, and low-power devices.

The prospects for asynchronous SRAM are promising and show potential for growth. Asynchronous SRAM offers significant advantages such as lower power consumption, reduced electromagnetic interference, and improved robustness against timing issues. These features make it appealing for applications that require reliable and efficient memory systems, including aerospace, automotive, and low-power devices. With the increasing demand for higher performance and power-efficient electronics, asynchronous SRAM provides a viable solution.
