According to our (Global Info Research) latest study, the global Attenuated Total Reflection Probes market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

The ATR probe consists of an ATR crystal tip at the end of the immersible section (the so-called shaft) and a mid-IR optical fiber split into 2 branches with an SMA connector. The ATR uses the total internal reflection properties of the crystal, which produces an evanescent wave. It extends into the sample medium, which may be a liquid, slurry or solid, and is used to measure media with very high optical density. It can be inserted directly into the sample for spectral measurements without diluting the sample.
