Abstracts

The global Auto Refilling and Draining Robotic Vacuum Cleaner market size is expected to reach \$ 4501 million by 2032, rising at a market growth of 19.5% CAGR during the forecast period (2026-2032).

Automatic Water-Fill and Drain Robotic Vacuum Cleaners are an automated upgrade segment within high-end robotic vacuum-mop cleaners. Their base stations can connect to household water supply and drainage systems, automatically refilling clean water, washing the mop, and disposing of wastewater during cleaning, thereby reducing the frequency of manual water refills, wastewater disposal, and water tank cleaning. These products often also integrate features such as automatic dust collection, hot-water mop cleaning, hot-air drying, automatic cleaning solution dispensing, and self-cleaning bases. Although this is a relatively small niche market, its global market size reached approximately USD 1 billion in 2025.

The essence of this category is to upgrade robotic vacuum-mop cleaners from “semi-automatic cleaning appliances” to “light-installation home cleaning systems.” Its core value is not simply to increase suction power, but to reduce maintenance tasks—particularly eliminating the need for frequent water refills, wastewater disposal, and mop cleaning—making it especially suitable for large homes, pet-owning households, heavy mopping needs, and high-end residential settings.

In the short term, automatic water-fill and drain functions are expected to first penetrate the high-end market in China and select overseas flagship models, as Chinese users are more receptive to all-in-one bases, built-in home installation, and high automation. In contrast, the European and U.S. markets are constrained by installation conditions,

rental housing prevalence, after-sales installation costs, and differences in plumbing standards.

From a competitive perspective, Chinese brands such as Roborock, ECOVACS, Dreame, Narwal, Xiaomi, and Eufy are the main drivers, while traditional overseas appliance brands have limited participation. From 2026 to 2032, this category is expected to maintain a CAGR of approximately 20%, significantly higher than the overall robotic vacuum market growth. However, it is unlikely to become a mass-market standard in the short term. The main reasons are that automatic water-fill and drain require proximity to water supply and drainage, and involve installation, leakage prevention, and after-sales service challenges. Therefore, it is more likely to first become an important differentiating feature for high-end robotic vacuum-mop cleaners rather than quickly replacing standard water-tank all-in-one bases.
