According to our (Global Info Research) latest study, the global Autofocus Microscope market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

An 'autofocus microscope' is a type of microscope equipped with an automated focusing mechanism that adjusts the focus of the microscope's lens or objective automatically. This automation eliminates the need for manual adjustment of the focus knob by the user.

Autofocus microscopes typically utilize sensors and algorithms to analyze the clarity and sharpness of the image being observed. Based on this analysis, the microscope's focusing mechanism adjusts the position of the lens or objective to ensure that the image remains in focus, even when the sample or specimen is moved or when different areas of the specimen are being examined.

These microscopes are commonly used in various fields such as biology, medicine, materials science, and quality control, where precise and efficient focusing is required for tasks such as live cell imaging, high-throughput screening, and automated inspection of samples.
