Abstracts

According to our (Global Info Research) latest study, the global Autofocus System market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Autofocus systems obtain focus through feedback from range-finding or other sensing methods. They measure a parameter, adjust the distance between the lens and the object's surface, and then measure the autofocusing (AF) parameter again. The process is repeated until the object is in focus according to the specified autofocusing parameter. Shallow depths of field, poor contrast in the sample, and low illumination can result in low-quality autofocusing. Dynamic focusing autofocus systems are used to continuously maintain focus, or for tracking a moving target. Some specialized autofocus systems use a laser to project a series of dots or lines onto the sample for autofocusing.
