An autogenous bone harvester is a specialized medical device used in orthopedic and maxillofacial surgeries. It is designed to extract a patient's own bone tissue, typically from areas like the iliac crest or tibia, in a precise and minimally invasive manner. By harvesting autogenous bone, surgeons can obtain a graft material that has excellent biocompatibility and osteogenic potential for use in procedures such as spinal fusions, dental implant placements, or bone defect reconstructions, facilitating better integration and healing within the patient's body.
