According to our (Global Info Research) latest study, the global Autolytic Debridement Dressings market size was valued at USD 105 million in 2023 and is forecast to a readjusted size of USD 159.1 million by 2030 with a CAGR of 6.1% during review period.

Autolyzing debridement dressing is a special dressing that can dissolve necrotic tissue through its own enzymatic activity to perform debridement. Such dressings usually contain active ingredients such as proteolytic enzymes, fibrinolytic enzymes, and collagenase. When the dressing comes into contact with the wound, these enzymes will dissolve necrotic tissue, remove it, and promote wound healing.

With the development of enzyme engineering and biotechnology, more efficient autolytic debridement dressings with stronger enzyme activity may be developed in the future, which can remove necrotic tissue faster and more thoroughly.
