## Abstracts

The global Automated Driving Sensor Chip market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Automated driving sensor chips are a key enabling technology for autonomous vehicles and advanced driver assistance systems (ADAS). These chips are designed to detect and interpret data from multiple sensors, allowing the vehicle to perceive its environment and make driving decisions with little or no human input. Automated driving sensor chips typically integrate multiple sensor technologies, including LiDAR, radar, cameras, ultrasonic sensors, and IMUs. These sensors can be used for a range of functions such as object detection, localization, mapping, and path planning. Sensor fusion techniques are used to combine the information from multiple sensors, providing a more complete and accurate perception of the environment. Automated driving sensor chips are a combination of multiple sensors and algorithms, working together to provide a vehicle with accurate perception and decision-making capabilities. These chips enable vehicle automation, making driving safer, more efficient and more enjoyable.
