Abstracts

Peritoneal Dialysis is a treatment method to purify the blood by using the patient's own peritoneum as a dialysis membrane. Usually, 1.5 to 2 L of dialysate is put into the abdominal cavity through the catheter (tube) inserted by surgery, and it is exchanged about 3 to 5 times a day. The amount and number of fluids are determined by the physique, physical condition, examination data, etc. of the patient. One dialysis solution exchange can be done in about 30 minutes and they can spend their daily life as usual other than that. Dialysis is always carried out while spending everyday life.
