An Automatic Assembly Machines is a dedicated system utilizing mechanized and automated devices for producing goods and performing various functions in an assembly line. Its basic functionality is an organized approach of assembling goods which is partly automated and partly controlled by humans. For this purpose, Automatic Assembly Machines performs a series of automated operations for combining multiple components into a single unit which can be used as a final product or sub assembly. Generally, automated machinery is used to produce products in which standard components or parts are added in a definite sequence of events along what is commonly called an assembly line. Automated assembly system forms an integral part of the process in many technical organizations, manufacturing industries, medical research, clinical companies, etc. Some of the advantages of assembly process from conventional automation systems are in terms of labor savings, consistency of input and output, capability to handle multiple tasks so as to meet demands of a manufacturing process, better reliability and profitability through higher production rate. Assembly automation is the application of robotics, software, digitalized data, and plant design engineering to manufacturing processes to minimize manual labor requirements while maximizing efficiency, safety, and output. Advancements in industrial automation technologies such as artificial intelligence, machine vision, complex robotics and other controls are making automated assembly more flexible, efficient, and rapid than ever before.

Global key players of Automatic Assembly Machines include Grob, ATS Automation Tooling Systems, Durr, etc. The top three players hold a share of 18%. North America is the largest market, with a share of 41 percent, followed by Europe and Asia-Pacific, with share 28% and 26%, separately. In terms of product type, Semi-automatic Assembly Machines is the largest segment, with a share of 64%. And in terms of application, Automotive has a share about 33%.
