The global Automatic COD Digestion System market size is expected to reach \$ 250 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

The automated COD digestion reflux unit is a piece of laboratory equipment utilized in water quality analysis experiments, primarily for the digestion of water samples prior to the determination of Chemical Oxygen Demand (COD). The device facilitates a heating reaction between water samples and reagents under conditions of constant temperature and a specified duration, thereby oxidizing and decomposing the organic matter present in the samples and establishing stable reaction conditions for subsequent COD measurement. Upon completion of the digestion process, the COD value is typically determined using spectrophotometry or titration methods. The upstream segment of the industry supply chain comprises suppliers of heating modules, temperature controllers, digestion tubes, electronic control boards, and laboratory glassware; the midstream segment consists of equipment manufacturers responsible for system integration, temperature control system design, safety structure design, and equipment calibration; the downstream segment primarily serves environmental monitoring laboratories, municipal wastewater treatment plants, industrial wastewater testing facilities, scientific research institutions, and third-party environmental testing agencies. In 2025, the global production volume of automated COD digestion reflux units is projected to reach approximately 66,700 units, with an average market price of approximately \$2,400 per unit. The gross profit margins of major manufacturers within the industry generally range between 30% and 46%. The global production capacity for 2025 is estimated at approximately 88,900 units.
