Abstracts

According to our (Global Info Research) latest study, the global Automatic Cryostat Microtomes market size was valued at US\$ 194 million in 2024 and is forecast to a readjusted size of USD 264 million by 2031 with a CAGR of 4.5% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The automatic cryostat microtome is a medical or laboratory equipment, specifically designed to rapidly and automatically cut frozen biological tissues or other materials into thin slices. It combines refrigeration technology with automatic slicing technology, enabling tissue slicing in a low-temperature environment. This equipment is primarily used in pathology laboratories and for rapid pathological diagnosis during surgery.

Working principle and advantages

The automatic cryostat microtome is mainly composed of three major parts: a refrigeration system, a slicing system, and a control system. Its working principle involves using physical cooling methods to freeze fresh tissue samples to a certain hardness, and then slicing them into thin sections using the blade of the microtome. Compared with conventional pathological slicing machines, the biggest feature of them is that they operate in a frozen environment. The conventional ones are typically used to process tissues that have undergone fixation treatments such as paraffin embedding, whereas automatic cryostat microtomes can quickly process tissues by directly slicing frozen, fresh tissues, significantly reducing diagnosis time.

Major market participants

Currently, the global market for automatic cryostat microtomes is dominated by a few large enterprises, such as renowned international brands like Leica and AMOS. Domestic enterprises such as Dakewe and Biobase are also rising rapidly, gradually gaining market share through technological innovation. For example, Dakewe's multi-point temperature control technology greatly reduces cooling time while ensuring temperature stability during the slicing process. With advancements in slicing technology and control systems, automatic cryostat microtomes can achieve clearer and more accurate slicing results.

Market development trends

Hospitals of various levels, scientific research institutions, biomedical enterprises, and other entities are significant demanders of automatic cryostat microtomes. As medical technology continues to advance, the demand for pathological diagnosis increases, and scientific research activities become more frequent, the market size of them is expanding. In the medical field, early diagnosis, precision treatment, and personalized treatment are future trends that will broaden the application of automatic cryostats in pathology departments and other areas. In the scientific research field, as life science research deepens and the precision requirements for tissue and cellular structures increase, automatic cryostat microtomes will also play a crucial role. Additionally, in the 5G era, with the continuous development of artificial intelligence, the Internet of Things, and other technologies, the technological innovation of automatic cryostat microtomes will accelerate, further enhancing the degree of automation of the equipment. In the future, automatic cryostat microtomes with intelligent diagnostic functions may emerge, capable of automatically identifying diseased areas of tissues and performing precise slicing and analysis.
