## Abstracts

According to our (Global Info Research) latest study, the global Automatic Direction Finder market size was valued at USD 102.3 million in 2023 and is forecast to a readjusted size of USD 124.7 million by 2030 with a CAGR of 2.9% during review period.

Automatic Direction Finder is an instrument that intercepts and uses electromagnetic radiation in the radio portion of the spectrum to determine the direction of the radio transmitter.

A direction finder (DF) can be used by an aircraft or ship as a navigational aid. This is accomplished by measuring the direction (bearing) of at least two transmitters whose locations are already known. When the measured directions from each transmitter are plotted on a map, the intersection of the two plotted lines gives the location of the aircraft or ship carrying the DF. This technique, using the directions to two or more transmitters of known location, is called triangulation.
