Abstracts

The global Automatic Hot Melt Welding Machines market size is expected to reach \$ 247.1 million by 2029, rising at a market growth of 3.6% CAGR during the forecast period (2023-2029).

A pipeline is as good as its weakest point. Accordingly it is not only important that quality pipes and components are used in a piping system, but also the methodology used to join the pipes and other components. Butt Fusion is the most important and widely used method of connection for HDPE pipes larger than 110 mm. It is a method of jointing pipe ends by way of heating and cooling under pressure, resulting in pipe joints as strong as the pipe itself. The principle of butt fusion is to heat the pipe ends to a designated temperature (200-220 C) under pressure for a specified amount of time, then the pipe ends are fused together under pressure for a period of time.

The Automatic Hot Melt Welding Machines used to weld plastic pipes have controls to ensure the welding parameters strictly. During the fusion process internal and external 'weld beads' are formed. Techniques have been developed to minimise the size of the beads, however as they do not add anything to the overall strength they may be safely removed if required. The removed weld beads can be inspected as part of a quality control programme.
