The fully automatic inorganic dilution standardization instrument is an instrument used to realize automatic dilution and preparation of inorganic solutions. It can automatically mix the concentrated inorganic solution with the solvent in a certain proportion according to the ratio and concentration requirements set by the user, so as to obtain the required dilution of the target concentration. The automatic inorganic dilution and standardization instrument usually has the following characteristics and functions: 1. Automatic operation: the automatic inorganic dilution and standardization instrument can realize the whole process of automatic operation, including sample input, solution dilution, mixing and stirring, and result output, etc., reducing manual labor. operational intervention. 2. High precision and high repeatability: The automatic inorganic dilution and standardization instrument adopts a precise liquid delivery system and a metering device, which can realize high-precision solution dilution and preparation, ensuring the accuracy and repeatability of the results. 3. Multi-channel and high-throughput: The fully automatic inorganic dilution calibration instrument usually has multiple independent dilution channels, which can process multiple samples at the same time, improving work efficiency and sample processing capacity. 4. Programmability and flexibility: The fully automatic inorganic dilution standard matching instrument can be programmed flexibly according to the needs of users, and can set different ratios and concentration requirements to adapt to different experiments and application requirements.
