According to our (Global Info Research) latest study, the global Automatic Locking Differential market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A locking differential is a mechanical component, commonly used in vehicles, designed to overcome the chief limitation of a standard open differential by essentially 'locking' both wheels on an axle together as if on a common shaft. Automatic locking differentials lock and unlock automatically with no direct input from the driver. Some automatic locking differential designs ensure that engine power is always transmitted to both wheels, regardless of traction conditions, and will 'unlock' only when one wheel is required to spin faster than the other during cornering.
