Abstracts

The global Automatic Medicine Blister Packaging Machine market size is expected to reach \$ 809 million by 2032, rising at a market growth of 4.7% CAGR during the forecast period (2026-2032).

An automatic medicine blister packaging machine is a device used in the pharmaceutical industry to package individual doses of medications or pills into blister packs. Blister packs are pre-formed plastic or aluminum cavities that hold each dose of medication securely and provide protection against moisture, tampering, and contamination. In 2025, global Automatic Medicine Blister Packaging Machine production reached approximately 8,129 units, with an average global market price of around 70 K US\$/Unit. The production capacity of Automatic Medicine Blister Packaging Machine reaches 10,800 units, and the industry's gross profit margin is approximately between 25% and 45%.

Automatic pharmaceutical blister packaging machines have evolved from standalone forming and sealing units into integrated automated packaging systems that combine thermoforming or cold forming, automatic feeding, vision inspection, heat sealing, coding, die-cutting, rejection, serialization and traceability, cartoning line integration, and data recording capabilities. Current market demand is primarily concentrated in packaging applications for tablets, capsules, softgels, OTC medications, prescription drugs, clinical samples, and select medical consumables. Industry growth is driven by factors such as the global expansion of solid dosage manufacturing capacity, increased consumption of generic and OTC drugs, heightened requirements for pharmaceutical safety and moisture barrier protection, pharmaceutical companies' pursuit of GMP compliance and production efficiency upgrades, rising demand for high-barrier aluminum-aluminum packaging, and the widespread adoption of cartoning line

integration and serialization traceability systems. Large pharmaceutical enterprises tend to prioritize the acquisition of high-speed, integrated blister-to-carton lines to boost production capacity, minimize manual labor, and reduce packaging errors; conversely, small-to-medium-sized pharmaceutical firms and CDMOs place greater emphasis on rapid changeover capabilities, material compatibility, and the capacity for multi-product, small-batch production. Moving forward, automatic pharmaceutical blister packaging machines will continue to evolve toward higher speeds, greater flexibility, intelligent inspection capabilities, data traceability, energy efficiency and waste reduction, and compatibility with sustainable packaging materials.
