Abstracts

The global Automatic Medicine Packaging Machine market size is expected to reach \$ 2331 million by 2032, rising at a market growth of 6.5% CAGR during the forecast period (2026-2032).

Automatic Medicine Packaging Machine is a dispensing and packaging device that integrates mechatronics and information technology. Often referred to as a drug packaging machine, it is primarily used in hospital inpatient pharmacies, outpatient pharmacies, and other medical institutions. Its core working principle is to free pharmacists from the tedious task of manually dispensing medications. After receiving electronic prescriptions transmitted from the Hospital Information System (HIS), the machine automatically selects medications from the storage cabinet according to the prescription instructions and automatically packages the tablets or capsules for a single dose into the same medicine bag. Each individual medicine bag is then clearly printed with the patient's name, medication name, and usage instructions.

In 2025, global Automatic Medicine Packaging Machine sales reached approximately 1,404 K Units, with an average global market price of around 962 US\$/Unit. Production capacity reached 2,500 K Units, with a gross profit margin of approximately 35%.

The introduction of the Automatic Medicine Packaging Machine has profoundly transformed pharmacy workflows from 'people finding medicine' to 'medicine finding people.' This has not only effectively reduced the workload of pharmacists but also lowered the human error rate, often present in manual dispensing, to less than one in ten thousand through computer-controlled intelligent verification. Simultaneously, the machine significantly improves dispensing efficiency, with one machine capable of packaging approximately 60 packets per minute with an accuracy rate exceeding

99.5%, and patient waiting times for medication are greatly reduced. Furthermore, the automated dispensing of medications in a fully enclosed environment effectively avoids dust contamination and cross-infection, making it particularly suitable for routine medication use in inpatient wards and long-term medication management for patients with chronic diseases.
