According to our (Global Info Research) latest study, the global Automatic Mine Water Supply Self-Rescue Device market size was valued at US\$ 6.04 million in 2025 and is forecast to a readjusted size of US\$ 10.34 million by 2032 with a CAGR of 8.1% during review period.

The automatic mine water supply self-rescue device is an emergency rescue terminal designed for fixed installation near mining faces, escape routes, personnel gathering points, and emergency refuge facilities in coal mines or underground metal and non-metal mines. Connected to the mine's water supply network, it provides a continuous supply of potable water to personnel trapped after a disaster through mechanisms such as water storage, automatic replenishment, pressure reduction and stabilization, filtration and purification, and multi-outlet distribution. The "automatic" variant typically incorporates a buffer storage tank alongside mechanical systems for automatic replenishment, liquid level maintenance, or pressure regulation, allowing it to function using the pipeline network's static pressure and stored water even during power outages. These devices are primarily deployed at coal mining and tunneling faces, shaft-bottom stations, haulage roadways, pump rooms, substations, assembly points for personnel evacuating after blasting, long blind headings, and refuge chambers. The upstream supply chain primarily comprises stainless steel and carbon steel plates, copper and brass valves, pressure-reducing valves, pressure gauges, PP cotton filters, activated carbon, ultrafiltration membranes, plastic filter housings, rubber or food-grade hoses, seals, and fasteners. Midstream activities include sheet metal welding for the enclosure, design of piping and distribution systems, assembly of filtration components, pressure and flow calibration, airtightness and watertightness testing, water quality verification, and final product delivery. Downstream customers include coal mines and

underground mines.
