## Abstracts

Automatic mold temperature control is a system used in injection molding machines to regulate and maintain the temperature of the mold during the molding process. This is important because the temperature of the mold can affect the quality and consistency of the final product. The system typically consists of a temperature control unit that circulates a heat transfer fluid through the mold to keep it at the desired temperature. This helps to prevent issues such as warping, shrinkage, and uneven cooling of the plastic material being injected into the mold. By automatically controlling the temperature of the mold, manufacturers can achieve more consistent and high-quality results in their molding processes.

According to our (Global Info Research) latest study, the global Automatic Mold Temperature Control market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
