## Abstracts

The global Automatic Parking Robots market size is expected to reach \$ 881 million by 2032, rising at a market growth of 11.1% CAGR during the forecast period (2026-2032).

An automatic parking robot is a mechanical platform equipped with lifting, driving, and positioning systems that directly handles the physical movement of a vehicle after a driver exits. Its role is to replace the driver's steering, reversing, and parking actions with machine-controlled precision. By eliminating the need for human intervention inside the parking structure, the robot enables a more compact layout and reduces the space required for circulation paths. It further enhances safety by removing the risk of driver error and pedestrian presence within the automated zone. In 2025, global Automatic Parking Robots production reached approximately 4805 units with an average global market price of around k US\$85 per unit.

The core driving force for automatic parking robots is shifting from single hardware sales to robot-equipment-based operational services. According to official news from companies such as Shenzhen Yifeng Automation, their business model has expanded from selling automatic parking robot hardware to providing parking management services that include equipment maintenance, system upgrades, and robot dispatching platform-based services, generating sustainable revenue through long-term service contracts. This has increased the profit contribution rate of individual parking projects. The structural change in profit margins is also reflected in the deep integration with urban public facility construction. Annual reports from multiple companies show that bidding for government-led public parking lots, as well as livelihood projects such as hospitals and commercial complexes, has become the primary source of orders for automatic parking robot systems. The cooperation model has evolved from one-time procurement to a long-term ?construction plus operation? model, placing higher

demands on enterprises' capital operation capabilities and receivables management, which in turn directly impacts cash flow and profit margins.

Automatic parking robots are evolving from independent operations in a single parking lot towards a regional robot Internet of Things. Official urban planning documents from cities such as Shenzhen have explicitly incorporated intelligent parking robots into smart transportation management platforms. This means that automatic parking robots will no longer only serve a single parking facility, but will function as dispatching units for the city's micro-circulation transportation, achieving multi-parking-lot robot coordination and vehicle allocation through a unified cloud platform. This trend will force leading enterprises to increase their R&D investment in robot dispatching algorithms and cross-site cloud coordination platforms, creating extremely high technical barriers and further intensifying the Matthew effect. Revenue and profits will become increasingly concentrated among leading enterprises that possess both the capability to manufacture robot hardware and the experience in multi-parking-lot coordinated dispatching.

This report studies the global Automatic Parking Robots production, demand, key manufacturers, and key regions.
